                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence is a maize RAD51 orthologue protein #1. RAD51 is one CC of the genes of the RAD52 epistasis group that is involved in double strand breaks (DSBs) repair by homologous recombination. Control of homologous recombination by modulating RAD51 is used for improving transformation and gene targetting in transgenic plants. The RAD51 nucleotide may be used as probes or amplification primers for detecting, quantifying or isolating gene transcripts, in detecting deficiencies in the mRNA level during screening for desired transgenic plants, for detecting gene mutations, for monitoring upregulation of expression or changes in enzyme activity, for detecting any number of allelic variants, or transloques or paralogues of the gene, or for site directed mutagenesis in eukaryotic cells. It may also be used for recombinant expression of its encoded polypeptide, or for use as immunogen in preparing and/or screening of antibodies, and in sense or antisense suppression of one or more genes in a host cell, tissue or plant. The RAD51 proteins may be used in assays to agonise or antagonise the enzyme function, or as immunogens or antigens to obtain antibodies.

XY

New maize RAD51 polynucleotides, useful for e.g. controlling recombination or transformation efficiency in plants, or as probes or primers for detecting, quantifying or isolating gene recombination primers for detecting, quantifying or isolating gene primarscripts

XX

Claim 1; Page 74-75; 76pp; English.

XX

The present sequence is a maize RAD51 orthologue protein #3. RAD51 is one of the genes of the RAD52 epistasis group that is involved in double control of the genes of the RAD52 epistasis group that is involved in double control of the genes of the repeater by homologous recombination. Control of the genes of the repeater by homologous recombination of incollection primers for detecting the repeater by homologous recombination of incollection gene targetting in transgenic plants. The RAD51 control of the major isolating gene transcripts, in detecting plants. The RAD51 control of the major isolating gene transcripts, in detecting defliciencies in control gene mutations, for monitoring upregulation of expression or confidence in enzyme activity, for detecting any number of allelic variants, concluded polypeptide, or for use as immunogen in preparing and/or its encoded polypeptide, or for use as immunogen in preparing and/or concreasing of antibodies, and in sense or antisense suppression of one or used in assays to agonise or antagonise the enzyme function, or as immunogens or antigens to obtain antibodies.

RAD51 is one cof the genes of the RAD52 epistasis group that is involved in double strand breaks (DSBs) repair by homologous recombination. Control of homologous recombination by modulating RAD51 is used for improving transformation and gene targetting in transgenic plants. The RAD51 control of nucleotide may be used as probes or amplification primers for detecting, cquantifying or isolating gene transcripts, in detecting deficiencies in the mRNA level during screening for desired transgenic plants, for cdetecting gene mutations, for monitoring upregulation of expression or contrologues or paralogues of the gene, or for site directed mutagenesis in eukaryotic cells. It may also be used for recombinant expression of convergenes in a host cell, tissue or plant. The RAD51 proteins may be used in assays to agonise or antisones suppression of one or more genes in a host cell, tissue or plant. The RAD51 proteins may be
                                                                                                                                                                                                                                                                                                                                                             Query Match

ID AAY7
  leukaemia; immune disorders such as AIDS, Addison's disease, diabetes mellitus, rheumatoid arthritis, multiple sclerosis, systemic lupus erythematosus, and myasthenia gravis; infections and trauma. Antagonists of the HTRM polypeptides are useful for treating or preventing disorders associated with increased expression or activity of HTRMs. HTRM polypeptides, their immunogenic fragments or oligopeptides are useful polypeptides, their immunogenic fragments or oligopeptides are useful for screening libraries of compounds in drug screening techniques. Polypucleotides encoding HTRM are useful for blocking the transcription of mRNA and regulating gene function by modulating the activity of HTRM. Vectors expressing HTRM or agonists can also be used to prevent or treat disorder associated with decreased HTRM expression. Antibodies
                                which specifically bind HTRN and polynucleotides encoding HTRN are useful for diagnosing disorders associated with the expression of HTRN. particularly in assays that detect the expression of HTRN. Nucleotide sequences encoding HTRN may be useful to generate hybridization probes useful in mapping the naturally occurring genomic sequence and to detect differences in gene sequences among normal, carrier and affected individuals. Using diagnostic assays, cancer can be detected prior to the appearance of clinical symptoms and thereby progression of cancer can be prevented by aggressive treatment or preventive measures.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   protein sequences. The HTRM protein and nucleotide sequences are userul for preventing or treating disorders associated with decreased expression or activity of HTRM which include cell proliferative disorders such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAY73325-Y73389 are human transcriptional regulator molecule (HTRM) protein sequences. The HTRM protein and nucleotide sequences are useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Claim 1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        07-AUG-1998;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       B
                    The present sequence is Ala163 hsRec2, a human serine kinase modified a Y163A substitution. The hsRec2 is in the same supergene family as t mammmalian protein having homologous pairing and strand transfer activities, RAD51 and was isolated because of its homology to the homologous pairing and strand transfer protein of Ustilago maydis. In particular, hsRec2 phosphorylates several proteins that control the ce cycle, especially cyclin E and p53. The invention permits the phosphorylation of cell cycle control proteins at sites that are physiologically relevant. The invention can be practiced with either murine or human Rec2 or a mutein or chimera of these proteins. In
                                                                                                                                                                                                                                                                                                                                                                                                           Phosphorylating a serine-containing substrate by incubating it adenosine triphosphate and Rec2 kinase and measuring the level phosphorylation, useful for discovering specific antagonists of

Its amino acid sequence was deduced from cDNA clones (see AAV22703) isolated on the basis of homology to UmREC2. Overexpression of mammalian REC2 (see also AAW56265) in a cell facilitates homologous recombination between an exogenous DNA and the genome of a cell It also sensitises the cell to DNA damage, e.g. by gamma or UV radiation or from cytotoxic agents. This causes the cell to undergo apoptosis in response to DNA damage. The haracz gene can be used in gene therapy protocols and in a method for constitution of the cell to DNA damage.

murine or human Rec2 or a mutchin or chimera of these proteins. In particular the mutch has the sequence of a Rec2 kinase containing other than a Tyr at position 163. The invention comprises a method of phosphorylating a serine-containing substrate comprising incubating the substrate with ATP (adenosine triphosphate) and Rec2 kinase or a mammalian Rec2 and measuring the level of phosphorylation. The method is useful for discovering compounds which are specific antagonists or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            the same supergene family as the mammmalian protein having homologous pairing and strand transfer activities, RAD51 and was isolated because of its homology to the homologous pairing and strand transfer protein of Ustilago maydis. In particular, hsRec2 phosphorylates several proteins that control the cell cycle, especially cyclin E and p53. The invention permits the phosphorylation of cell cycle control proteins at sites that are physiologically relevant. The invention can be practiced with either marries by homes poor or marries of the proteins at sites that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Phosphorylating a serine-containing substrate by incubating it with adenosine triphosphate and Rec2 kinase and measuring the level of phosphorylation, useful for discovering specific antagonists or agonists of Rec2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              agonists of Rec2.

                                                                                                                                                                                                                                             recombination between an exogenous DNA and the genome of a cell. It also sensitises the cell to DNA damage, e.g. by gamma or UV radiation or from cytotoxic agents. This causes the cell to undergo apoptosis in response to DNA damage. The muREC2 gene can used in the construction of transgenic animals and knock-out mice useful as models for tumorigenesis induced by chemical pathogens.
                                                                                                                                                                                                                                                                                                                                     This polypeptide comprises the murine homologue, muREC2, of the ATP-dependent recombinase of Ustilago maydis (USREC2). Its amino acid sequence was deduced from a cDNA clone (see AAV2704) isolated on the basis of homology to UmREC2. Overexpression of mammalian REC2 (see also AAW56264) in a cell facilitates homologous

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       밁
                                                                                     The present sequence is the muRec2, a murine serine kinase. It is in the same supergene family as the mammmalian protein having homologous pairing and strand transfer activities, RADS1 and was isolated because of its homology to the homologous pairing and strand transfer protein of its homology in particular, muRec2 phosphorylates several proteins ustilago maydis. In particular, muRec2 phosphorylates several proteins that control the cell cycle, especially cyclin E and p53. The invention permits the phosphorylation of cell cycle control proteins at sites that are physiologically relevant. The invention can be practiced with either are physiologically relevant.
murine or human Rec2 or a mutein or chimera of these proteins. In particular the mutein has the sequence of a Rec2 kinase containing other than a Tyr at position 163. The invention comprises a method of phosphorylating a serine-containing substrate comprising incubating the substrate with ATP (adenosine triphosphate) and Rec2 kinase or a
                                                                                                                                                                                                                                                                                                  phosphorylating a serine-containing substrate by incubating it with adenosine triphosphate and Rec2 kinase and measuring the level of phosphorylation, useful for discovering specific antagonists or agonists of Rec2
                                                                                                                                                                                                                                                                                                                                                                                                                WPI; 2000-283562/24.

The AtDMC1 promoter and homologues can be used to confer meiosis specific expression on a sequence operably linked to the promoter. They can be used for e.g. ablation of meiotic cells and isolation of apomictic plants, designing an efficient homologous recombination system for plants, increasing meiotic recombination frequency, for introgression of alien chromosome segments into host plant, or altering normal events of cell cycle during the time of meiosis and producing male and female sterile plants. The promoters can also be used in searching for apomictic mutants or used by seed producers to produce seeds apomictically. They can also be used for

The two isolated cDNAs (AAZ11868 and AAZ11872) are more closely related to RAD51 family members expressed in mitotic cells than to the meiosis-specific homologues from plants (LIM15) and yeast (DMC1), despite the significant transcription levels of the genes, that have been detected primarily in immature ears and anthers that contain cells progressing through the early stages of meiosis. The sequences claimed by the invention can be used to modulate the activity of RAd51 recombinase in transgenic plants, especially in maize. The genes can be used in gene targeting systems and for generating transgenic plants, especially in agriculturally important crop plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This is the amino acid sequence of the ZmRAD51B recombinase enzyme. The RAD51 recombinase from 5. cerevisiae has a role in the catalysis of the in vitro pairing and strand exchange between circular viral single strand DNA and linear duplex DNA. The identification of the ZmRAD51 genes will allow the identification and characterisation of
                                                                                                                                                                                                                                                                                                                                                                                            Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                              DNA coding for a RAD51 protein having the amino acid sequence in AR78183 is claimed. The RAD51 protein, which contains an ATP-binding domain, is involved in DNA repair of mismatched base pairs and site-specific recombination in antibody gene rearrangements. The protein binds to double-stranded DNA to form a right-handed helical nucleoprotein that extends (by 1.5 times) the pitch of B-form DNA. As a result, the helix is unwound. The RAD51 protein will be useful in designing drugs to treat diseases associated with environmental DNA

NOTE: It currently consists of 1 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submitter. This sequence will be replaced by the finished sequence as soon as it is available and the accession number will be preserved.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                rel:81-298-38-7441, Fax:81-298-38-7468)
On Feb 28, 2001 this sequence version replaced gi:11136550.
Genes were predicted from the integrated results of the following:
GENSCANI.0, BLASTN2.0, BLASTN2.0 as well as SplicePredictor
(October 1998 version). The genomic sequence was searched against
NCBI NORREDUNGANT PROTEIN ACTABLES, nr
(ftp://ncbi.nlm.nih.gov/blast/db) and the cDNA sequence database at
RGP. Protein homologies of the coding regions were searched against
NCBI NORREDUNGANT PROTEIN ACTABLES.

NCBI NORREDUNGANT PROTEIN ACTABLES.

The identified cDNA sequences using BLASTN2.0. ESTS represent
the identified cDNA sequences using BLASTN2.0 with the
corresponding DDBJ accession no. and RGP clone ID.
A gene with identity or significant homology to a protein is
classified based on the protein name to indicate the homology level
such as same name, 'putative-' and '.like protein'. A gene without
significant homology to any protein but with EST homology (covering
'unknown' protein. A gene predicted with a gene prediction program
is classified as a 'hypothetical' protein.

The orientation of the sequence is from T7 to SP6 of the PAC clone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Agrobiological Resources, Rice Genome Research Program; Kannondai 2-1-2, Tsukuba, Ibaraki 305-8602, Japani (E-mail: tsasakieabr affrc.go.jp, URL.http://rgp.dna.affrc.go.jp/, Tel:81-298-38-7441, Fax:81-298-38-7468)

(ftp://arthur.epm.ornl.gov/pub/xgrail), Genefinder (Phil Green,
University of Washington), Genscan (Chris Burge,
http://gnomic.stanford.edu/GENSCANW.html), and NetPlantGene
(http://gnomic.stanford.edu/GENSCANW.html), and NetPlantGene
(http://www.cbs.dtu.dk/services/NetGene2/), searches of the
complete sequence against a peptide database and plant EST
databases at TIGR, and manual curations based on those analyses.
Annotated genes are named to indicate the level of evidence for
their annotation. Genes with similarity to other proteins are named
after the database hits. Genes without significant peptide
similarity but with EST similarity are named as 'unknown' proteins.
Genes without protein or EST similarity, that are predicted by two
or more gene prediction programs over most of their length are
annotated as 'hypothetical' proteins. Genes encoding tRNAs are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               l (bases 1 to 122871)
